

CUI · ITAR · NIST 800-171 · CMMC

Retire defense IT with **proof.**

Certified destruction for the **CUI and ITAR data** on your retired drives, laptops, and servers — plus the audit-ready documentation your **NIST 800-171 and CMMC** obligations require. CyberCrunch is the disposal-end partner that destroys the data *and* proves it.

WHY NOW

CMMC requirements began appearing in DoD contracts in **November 2025**, and from **November 2026** many contractors handling CUI will need an independent, third-party assessment to win — and increasingly to retain — work. Passing means proving **every** requirement, including that retired media was destroyed correctly. The sooner that documented destruction trail is in place, the smoother the audit.

How we fit your compliance

Your data

CUI and ITAR technical data on retired drives, laptops, and servers.

Your obligation

NIST 800-171 requires data-bearing media to be sanitized before disposal or reuse — and CMMC requires you to prove it.

Our role

We destroy every data-bearing device to NIST 800-88, matched to media type and to your requirements — including **on-site (mobile) shredding and 2mm particle size** when your contract or policy calls for it.

Your proof

A serialized Certificate of Data Destruction and Certificate of Recycling — the evidence your CMMC assessor and ITAR program want to see.

What you get

- **NAID AAA** destruction — on-site (mobile) or at our facility, both ITAR-compliant
- **NIST 800-88** sanitization — wipe, degauss, or shred, matched to each media type
- Every asset handled by vetted, background-checked **U.S.-person staff**
- **Provable chain of custody** — GPS-tracked transport, photo-documented pickup
- **Serialized, per-unit reporting** tied to each asset's serial number for full auditability
- **R2v3 · RIOS · PA DEP permitted**, backed by up to \$10M cyber coverage

Make your next disposition audit-ready.

Request a quote, a sample destruction report, or a walkthrough of our chain of custody.
